WHERE IT GOES

This part in colour, its neighbours in grey

HOW TO MAKE IT AND HOW IT FITS

Torque tube 845 long. Arms 812 of RHS, axle centres 900 from the tube centre; near arm 55 in from the near end, far arm 795.

Weld both arms on a flat jig so the axle holes line up within 1.

Reel end of each arm: a 100 x 90 x 40 block bored 60 for the bush; near block sawn and bolted (cap); far block open at the top (saddle).

Two lever plates 280 x 50 x 8 on the tube behind the pivot, 50 apart inside, holes 16.5 at 250 from the tube centre for the nut block.

Press in the UHMW bushes: 40 bore at the near end, 60.3 at the far.

Fits: near bush turns on the jackshaft, far bush on the pivot tube.

Check: axle bar passes both blocks with the tube on a 40/60 mandrel.
